

Lab 4 verification evidence

Issue #53 | Pull Request #60 | Ready for peer review

Tested code revision **636cc00** on **feature/lab4-verification-evidence-53**, targeting **lab4-staging**. Checks were run on 2026-10-04 using isolated local PostgreSQL databases on port 5433. No database credentials or generated seed passwords are included.

SERVER	CLIENT	BROWSER / RESPONSIVE	PERFORMANCE
164 / 164 passed Build passed	89 / 89 passed Build passed	11 passed 10 intentional skips 0 failed	40 requests 0 failures <1s each

Database and seed safety

The E2E runs used separate guarded databases: **toktickit_lab4_e2e** and **toktickit_lab3_e2e**, both on 127.0.0.1:5433. The supplied local credentials were read only in-process. Disposable seed passwords were generated for each run and were never persisted. No production or personal-data database was used.

Scope note

This is the Issue #53 verification PDF for peer review. Final integration and the course submission PDF for Answer Parts 1-9 remain release work tracked by Issue #54.

GitHub reports no configured CI status checks for this branch; the results in this report are local test runs.

Verification results

CHECK	RESULT	EVIDENCE
Server regression	28 files; 164 passed, 0 failed, 0 skipped	Full Server suite with dedicated local database
Client regression	20 files; 89 passed, 0 failed	Full Client suite
Production builds	Server and Client builds passed	TypeScript and Vite production build
Migration / seed	5 migrations; none pending; repeatable seed passed	E2E-00 on `toktickit_lab4_e2e`
Browser suite	21 total; 11 passed, 10 intentional skips, 0 failed	Desktop mutations once; responsive checks per viewport
Lab 1-3 browser regression	42 total; 26 passed, 16 intentional skips, 0 failed	Separate `toktickit_lab3_e2e` database
Responsive evidence	6 checks passed; 12 screenshots	Desktop, tablet, and mobile
Diff hygiene	`git diff --check` passed; no unfinished markers found	Reviewed source and documentation paths

Regression compatibility fix

The legacy Staff status-flow test now sends the current status it read as the request precondition. The Lab 4 browser setup also uses the same loopback host for the UI and API, preventing first-login session-cookie loss. Both fixes were included in the tested revision.

Performance and browser scan

Endpoint	Requests	Max duration	Failures
Staff Dashboard	10	381 ms	0
Requester Dashboard	10	9 ms	0
Staff Actions list	10	9 ms	0
Requester Actions list	10	10 ms	0

PERF-04 issued 40 sequential requests total. Every request completed below the 1,000 ms threshold; bounded response checks passed.

Browser console/network scan

Each of the six responsive checks observed two expected unauthenticated GET /api/auth/me responses (401) while checking session state. Across those checks there were **0 unexpected HTTP failures**, **0 uncaught page errors**, and **0 unexpected console errors**. Any other non-2xx response or console/page error fails the test.

Responsive screenshot set

Twelve actual screenshots are included in the repository under artifacts/lab-04/screenshots/: Requester Dashboard, Requester Ticket Detail, Staff Dashboard, and Staff Actions Taken editor, each at desktop, tablet, and mobile sizes.

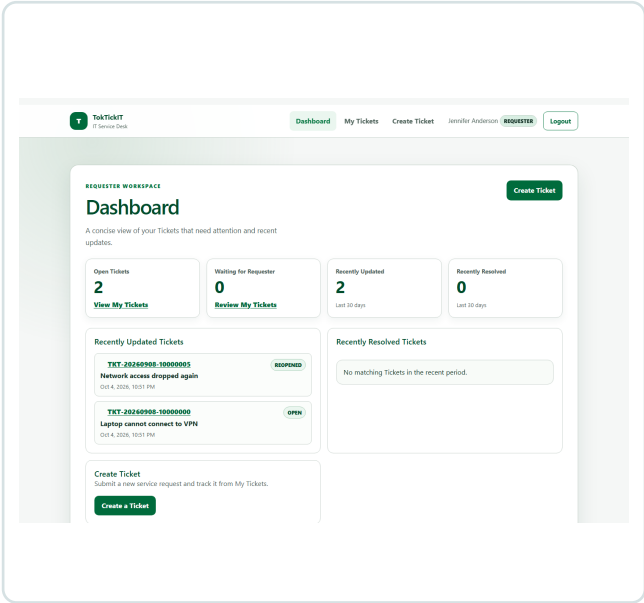

Playwright reports

Full HTML report: artifacts/lab-04/evidence/playwright-report/index.html. Test trace attachments are under artifacts/lab-04/test-results/ and are not failures in the final run.

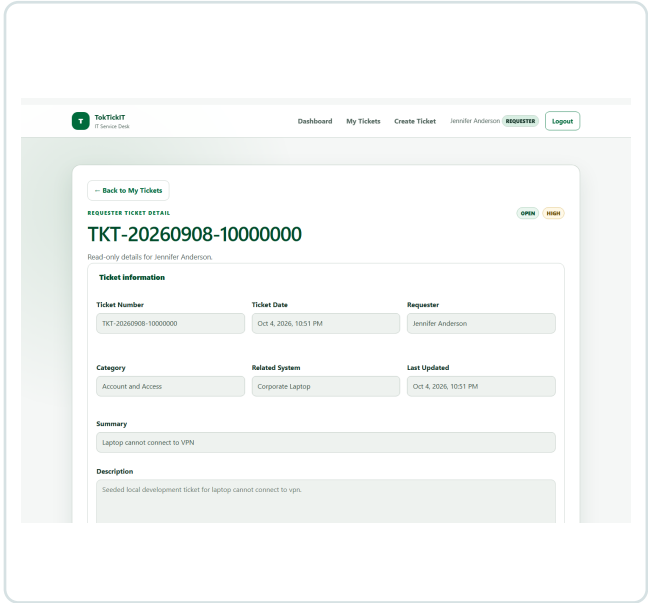

Desktop screenshots

Captured by the passing responsive E2E checks; the viewport-fit and browser-error assertions passed.
